## Oil sampling, method

#### WARNING!

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

#### Cause and action

In order to achieve an oil analysis that is as correct as possible it is important that the oil is taken from the machine in a correct way (see also *Oil sampling, sampling points*) and that the form for the oil analysis is filled in correctly.

#### Form for oil analysis

Fill in the boxes for the respective samples with regard to oil brand, number of operating hours for the oil and the oil grade.

System Sam	pled
	Engine (E)
Oil Changed	Yes / No
Oil Brand	Volvo
Oil Hours	510
Oil Grade	15W40 VPS-3
	V0013699
	V1057053

Skövde	530		J
Staffanstorp	570	57055	_

Fig.3 Example of to where the test result is to be sent

Attach identical labels in the intended box on the form and on the bottle with the oil sample.

Fill in to which workshop the test results should be sent.

Send off the sample immediate according to local procedures in order to get the test result as early as possible.

- 2 Lock nut
- 3 11411003 Vacuum pump
- 4 Oil-sample bottle

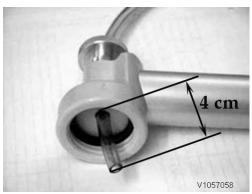

Fig.6 Installing hose

Fig.7 Removing hose

#### Instructions for vacuum pump

Use a new hose for each sampling. Store the pump in a clean place, when it is not used.

#### Installing hose

- 1 Cut a hose to a suitable length.
- 2 Insert the hose through the head of the vacuum pump. The hose should protrude 4 cm (1.6 in) outside the base of the pump head.
- 3 Tighten the lock nut.

#### Removing hose

- 1 Loosen the lock nut.
- 2 Cut off the hose above the lock nut and pull the hose out of the pump.
  - **NOTE!** Check that the hose ends do not contaminate the pump head with oil.
- 3 Take care of the hose in an environmentally safe way.

- 3 Cylinder
- 4 O-ring
- 5 O-ring
- 6 Lock nut

#### Cleaning vacuum pump

The vacuum pump must be cleaned after each sampling to prevent any residual oil in the vacuum pump from contaminating future oil samples.

- 1 Dismantle the vacuum pump.
- Wipe the parts with a clean lint-free paper or rag. Apply a thin coat of silicone grease to the O-rings. When required, use compressed air for cleaning.
- 3 Assemble the vacuum pump and test its function.

**NOTE!** The vacuum pump must not be cleaned with diesel fuel, petrol or cleaning agent.

#### Oil sampling methods

The following applies to all methods:

- · Make sure that oil-sample bottle is completely clean.
- Operate the machine until all systems have reached normal working temperature.
  - During the warming-up, all functions should be operated. It is important that all functions connected to the hydraulic system are operated to their respective end positions.
- · Take the oil samples immediately after the warming up.
- Seal the oil-sample bottle thoroughly to avoid contamination and loss of oil during the transport.

#### A) Oil sample method with hose (pressurised system)

This method is used for engine, transmission and working hydraulics.

#### Tools:

14025152 Hose with nipple

- 1 Start the engine.
- 2 Connect the hose to the machine so that oil begins to run out into the hose.

**NOTE!** Collect the oil that is running out in a suitable vessel. Drain off 2–4 dl (6.8–13.6 US fl oz) into the vessel.

- 3 Slacken the hose connection to stop the oil flow.
- 4 Remove the vessel with the oil and make sure that it is taken care of in an environmentally safe way.
- 5 Make sure that it is possible to collect oil in the oil-sample bottle.
- 6 Tighten the hose connection again and fill the sample bottle 3/4 full.
- 7 Put the cap on oil-sample bottle. Attach one label to the bottle and one label to the form for oil analysis.
- 8 Remove the hose.
- 9 Stop the engine.

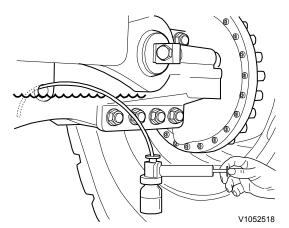

Fig. 10 Example of test method with vacuum pump.

#### B) Oil sample method with vacuum pump

The same method is used for axles, engine, dropbox and hub reduction gears.

#### Tools:

11411003 Vacuum pump

#### 941363 Hose

- 1 Cut the hose to a suitable length and connect it to the vacuum pump.
- 2 Install oil-sample bottle on the vacuum pump.
- 3 Insert the hose at the testing point.
  NOTE! Make sure that the oil sample is not taken from the bottom, but rather in the middle or within the working range of the oil
- 4 Draw up oil to flush out the hose.
- 5 Remove the oil-sample bottle and empty it. Make sure that the oil is taken care of in an environmentally safe way.
- 6 Install oil-sample bottle on the vacuum pump and fill the sample bottle 3/4 full.
- 7 Remove the oil-sample bottle and put on the cap. Attach one label to the bottle and one label to the form for oil analysis.

Fig.12 Example of sampling method with quickaction coupling

# C) Oil sample method with quick-action coupling (pressurised systems), earlier machines

This method is used for engine, transmission and working hydraulics on earlier machines with TEMA-coupling.

Tools: Snap-on coupling 941363 Hose

- 1 Cut the hose to a suitable length and connect it to the quickaction coupling.
  - **NOTE!** A new hose should be used for each sampling.
- 2 Start the engine.
- 3 Connect the quick-action coupling to the machine and open the breather valve so that oil begins to run out into the hose. NOTE! Collect the oil that is running out in a suitable vessel. Drain off 2–4 dl (6.8–13.6 US fl oz) into the vessel.
- 4 Close the breather valve to stop the oil flow.
- 5 Remove the vessel with the oil and make sure that it is taken care of in an environmentally safe way.
- 6 Make sure that it is possible to collect oil in the oil-sample bottle.
- 7 Open the breather valve again and fill the sample bottle 3/4 full.
- 8 Close the breather valve.
- 9 Put the cap on the oil-sample bottle. Attach one label to the bottle and one label to the form for oil analysis.
- 10 Remove the quick-action coupling.
- 11 Stop the engine.
