

[Sandeno East Asphalt Plant] DCONSTRUCTIONDEAST

Customer: PTRHTF30107	System Information	Sample Information
D-CONSTRUCTION 16805 QUARRY RD MORRIS, IL 60450 USA Attn: Chris Lenzie Tel: (815)405-6831 E-Mail: clenzie@sandenoinc.com	System Volume: 350 gal Bulk Operating Temp: 500F / 260C Heating Source: Blanket: Fluid: PETRO CANADA PETRO-THERM Make: BURKE	Lab No: 02542196 Analyst: Yvette Trzcinski Sample Date: 02/08/23 Received Date: 02/28/23 Completed: 03/06/23 Yvette Trzcinski yvette.trzcinski@HFSinclair.com

Recommendation: Pentane Solids are very high as is the acid number I recommend resampling to ensure this is a representative sample of the oil in the system before making any recommendations.

Comments: Pentane Insolubles levels are severely high. Acid Number (AN) is abnormally high. Visc @ 40°C is abnormally low.

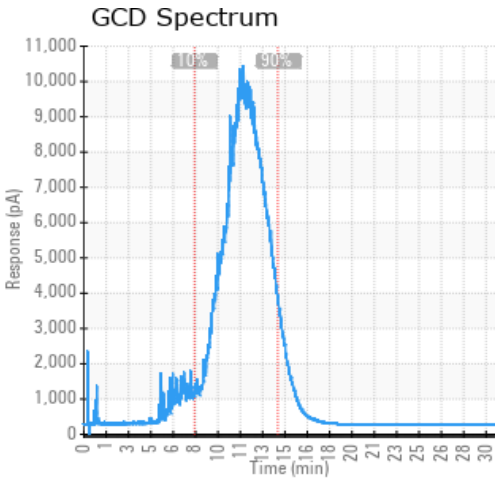
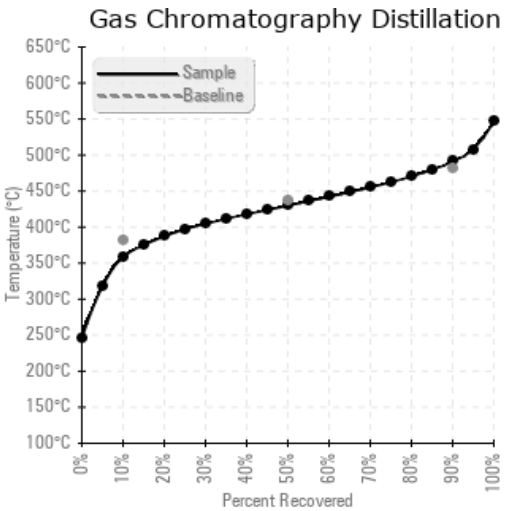
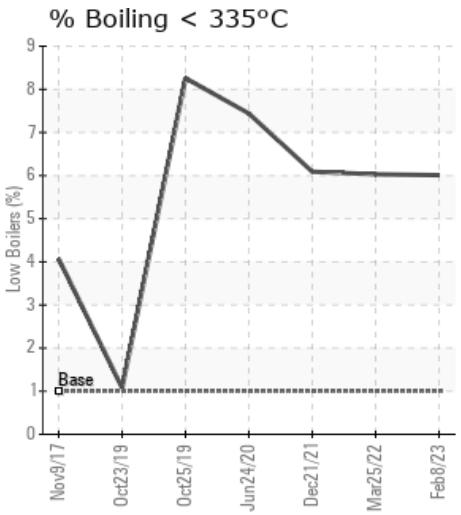
Elemental anaysis results (above) in parts per million (ppm). [10,000 ppm = 1.0%]







Historical Comments

03/25/22	The fluid viscosity, boiling points and insolubles are all with in specification. There is a slight decrease in the flash point due to some low boilers (GCD % < 335 C) which are low viscosity components due to degradation in the system. Venting of the low boilers is an option if they continue to increase. Fluid is acceptable for continued usage resample in 6-12 months.
12/21/21	The fluid parameters are all in specification except for the high acid number I suggest resampling in 6 months to monitor the acid number if it continues to increase look to sweeten the system with new heat transfer fluid. Acid Number (AN) is abnormally high.
06/24/20	acceptable for continued service - sample in 1-2 months to monitor total acid number and low boilers - operating temperature of the system is 325 F Pentane Insolubles levels are abnormally high. Acid Number (AN) is abnormally high. (GCD) % < 335°C is marginally high. (GCD) 10% Distillation Point is marginally low.
10/25/19	Fluid shows signs of degradation - acid number is high the pentane insoluble are high and there are low boilers in the system that can cause pump cavitation if not removed. There also seems to be contamination of the heat transfer system with either hydraulic or engine oil due to the zinc contamination. Recommend venting the system to remove low boilers for this fluid now and consider scheduling a system changeout - drain, clean and recharge of the system Pentane Insolubles levels are abnormally high. Zinc ppm levels are severely high. Acid Number (AN) is abnormally high. (GCD) 90% Distillation Point is abnormally low. (GCD) % < 335°C is marginally high. (GCD) 10% Distillation Point is marginally low. (GCD) 50% Distillation Point is marginally low.
