## WEAR PARTICLES

### Machine Id 05936885 Component

Filter Fluid PG 46 (10 GAL)

### DIAGNOSIS

### Recommendation

The filter change at the time of sampling has been noted. We recommend an early resample to monitor this condition.

### Wear Particles

The most likely alloy match is Low alloy steel 92XX (92XX). Wear particle analysis indicates that the ferrous rolling and ferrous rubbing particles are severe. Wear particle analysis indicates that the ferrous spheres and ferrous black oxides particles are abnormal. Wear particle analysis indicates that the ferrous sliding particles are marginal. Black oxides are produced when metal particles are completely oxidized. This can be caused by insufficient or spent lubricant, or extreme heat at the wear surface. Tempered wear particles exhibit blue and/or purple colors. The colors are the result of oxidation of the particle and signify high heat in the area that the particle was formed.

### Contaminants

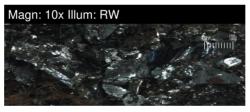

The filter contained only normal levels of contaminants, and debris. All filter contaminant levels are normal.
