Component  
Pump  
Fluid  
MOBIL SHC 626 (1 GAL)

### DIAGNOSIS

#### ▲ Recommendation

We recommend you service the filters on this component. Resample at the next service interval to monitor. Analytical Ferrography: Results appear normal with typical amounts of ferrous rubbing wear and contamination. Particle count can be elevated with no evidence on analytical Ferrography when there is virtually no wear involved to hold debris on the slide and that may be the case here; if this system is filtered then a filter service is suggested along with investigation into the source of debris, but if filtration is not an option with such a small sump then investigate for the source of contamination if possible.

#### Wear

All component wear rates are normal. The analytical ferrographic results are normal indicating no abnormal wear in the system.

#### ▲ Contaminants

There is a high amount of particulates present in the oil.

#### Oil Condition

The AN level is acceptable for this fluid. The oil is still serviceable provided that the contaminant(s) can be reduced to acceptable levels.

### WEAR

All component wear rates are normal.  
 The analytical ferrographic results are normal indicating no abnormal wear in the system.
