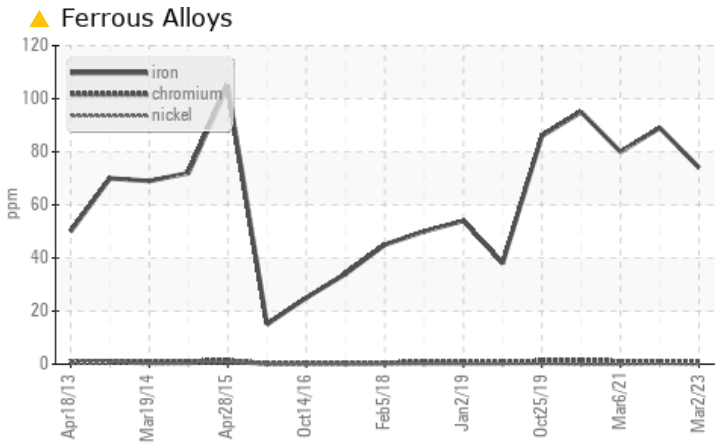
COMPONENT CONDITION SUMMARY



RECOMMENDATION

No corrective action is recommended at this time. Resample at the next service interval to monitor. Analytical Ferrography: Results indicate normal operation, with typical amounts of ferrous rubbing wear and contamination present. Iron in the metals analysis is not present as wear in the Ferrography, and the result has been stable and downward trending, suggesting that this wear is likely submicron-sized and present from time on oil or a similar issue more than any actual wear concern.

RECOMMENDED ACTIONS

There are no recommended actions for this sample.

HISTORICAL DIAGNOSIS

26 Jan 2022 Diag: Aaron Black

WEAR

Resample at the next service interval to monitor.Iron ppm levels are abnormal. The low ferrous density (PQ) index indicates the wear metal levels are due to corrosion. Analytical ferrography: wear is normal with typical amounts of ferrous rubbing wear. The system cleanliness is acceptable for your target ISO 4406 cleanliness code. The water content is negligible. The system and fluid cleanliness is acceptable. Analytical ferrography: contamination is normal with typical amounts of external debris present. The AN level is acceptable for this fluid. The condition of the oil is suitable for further service.

WEAR

No corrective action is recommended at this time. Resample at the next service interval to monitor.The iron level is abnormal. The system cleanliness is acceptable for your target ISO 4406 cleanliness code. The water content is negligible. The system and fluid cleanliness is acceptable. The AN level is acceptable for this fluid. The condition of the oil is suitable for further service.

view report

25 Jul 2020 Diag: Doug Bogart

WEAR

No corrective action is recommended at this time. The filter change at the time of sampling has been noted. Resample at the next service interval to monitor. All ferrographic tests and evaluation performed at WC Canada laboratory.An increase in the iron level is noted. All other component wear rates are normal. The direct-reading & analytical ferrographic results are normal indicating no abnormal wear in the system. The system cleanliness is acceptable for your target ISO 4406 cleanliness code. The system and fluid cleanliness is acceptable. The AN level is acceptable for this fluid. The condition of the oil is suitable for further service.

DIAGNOSIS

Recommendation

No corrective action is recommended at this time. Resample at the next service interval to monitor. Analytical Ferrography: Results indicate normal operation, with typical amounts of ferrous rubbing wear and contamination present. Iron in the metals analysis is not present as wear in the Ferrography, and the result has been stable and downward trending, suggesting that this wear is likely submicron-sized and present from time on oil or a similar issue more than any actual wear concern.

Wear

Gear wear is indicated.

Contaminants

The amount and size of particulates present in the system are acceptable. There is no indication of any contamination in the oil.

Oil Condition

The AN level is acceptable for this fluid. The condition of the oil is suitable for further service.
